

VORLI ONE-PAGER

VORLI is an AI-native language platform designed to close the speaking gap: the gap between knowing a language and using it confidently in real life.

The problem

Most language apps train recognition. Real life demands output.

People can understand a lot, but freeze when they have to speak.

What VORLI does

VORLI trains production under pressure through short, repeatable speaking practice:

- 90-second speaking missions (speak out loud, not multiple choice)
- Lifelike AI tutor with real-time lip-sync
- "For You" adaptive learning feed that continuously updates to your real life
- Point & Learn: camera-based contextual learning in the real world
- CEFR-aligned progress and confidence signals (not streaks)

Global from day one

- Interface available in 50 languages
- Architecture built to support 100+ learning languages
